# VOCABULARY

## VUs

A Virtual User is a simulation of a real user making requests to the system. Multiple VUs are executed concurrently to simulate traffic to the website or API.

## Throughput

The amount of transactions the system under test can process, showing the capacity of the website or application.

## Checks

A check is an assertion that the system under test behaves correctly, e.g. that it returns the correct status code. They do not halt the execution of the test, but acts as a pass/fail metric.

## Response Time

The time from sending the request, processing it on the server side, to the time the client received the first byte.

## Latency

The time that data sent or received spends on the wire, i.e. from the start of data being transmitted until all the data has been sent.

## Thresholds

Thresholds are a pass/fail criteria used to specify the performance expectations of the system under test.
